Answers:

1. Suppose that number of accidents at a construction site follows a Poisson process with the average rate of 0.80 accidents per month. Assume all months are independent of each other.

“Hint”: If $T_\alpha$ has a Gamma ($\alpha$, $\theta = 1/\lambda$) distribution, where $\alpha$ is an integer, then

$$F_{T_\alpha}(t) = P(T_\alpha \leq t) = P(X_t \geq \alpha) \quad \text{and} \quad P(T_\alpha > t) = P(X_t \leq \alpha - 1),$$

where $X_t$ has a Poisson ($\lambda t$) distribution.

a) Find the probability that the first accident of a calendar year would occur during March.

$T_1$ has Exponential distribution with $\lambda = 0.80$ or $\theta = 1/0.80 = 1.25$.

$$P(2 < T_1 < 3) = \int_{2}^{3} 0.80 e^{-0.80t} \, dt = e^{-1.60} - e^{-2.40} \approx 0.1112.$$  

OR

$$P(2 < T_1 < 3) = P(T_1 > 2) - P(T_1 > 3) = P(X_2 = 0) - P(X_3 = 0)$$

$$= P(\text{Poisson}(1.60) = 0) - P(\text{Poisson}(2.40) = 0) = 0.202 - 0.091 = 0.111.$$  

OR

$$P(\text{no accidents during the first two months} \quad \text{AND} \quad \text{at least one accident during the third month})$$

$$= P(X_2 = 0) \times P(X_1 \geq 1) = 0.202 \times (1 - 0.449) \approx 0.111.$$
b) Find the probability that the third accident of a calendar year would occur during April.

\( T_3 \) has Gamma distribution with \( \alpha = 3 \) and \( \lambda = 0.80 \) or \( \theta = \frac{1}{0.80} = 1.25 \).

\[
P(3 < T_3 < 4) = P(T_3 > 3) - P(T_3 > 4) = P(X_3 \leq 2) - P(X_4 \leq 2)
\]

\[

c) Find the probability that the third accident of a calendar year would occur during spring (March, April, or May).

\( T_3 \) has Gamma distribution with \( \alpha = 3 \) and \( \lambda = 0.80 \) or \( \theta = \frac{1}{0.80} = 1.25 \).

\[
P(2 < T_3 < 5) = P(T_3 > 2) - P(T_3 > 5) = P(X_2 \leq 2) - P(X_5 \leq 2)
\]

\[
= P(\text{Poisson}(1.6) \leq 2) - P(\text{Poisson}(4.0) \leq 2) = 0.783 - 0.238 = 0.545.

$$P(X + Y < 2) = \int_0^1 \left( \int_0^{2-x} \frac{9}{2(2x+y)^3} dy \right) dx$$

$$= \int_0^1 \left( -\frac{9}{4(2x+y)^2} \right)^{2-x} dx$$

$$= \int_0^1 \left( -\frac{9}{4(2x+1)^2} - \frac{9}{4(x+2)^2} \right) dx$$

$$= \left( -\frac{9}{8(2x+1)} + \frac{9}{4(x+2)} \right)^1_0$$
