Gamma Distribution:

\[
f(x) = \frac{1}{\Gamma(\alpha) \theta^\alpha} x^{\alpha-1} e^{-x/\theta}, \quad 0 \leq x < \infty
\]

\[
f(x) = \frac{\lambda^\alpha}{\Gamma(\alpha)} x^{\alpha-1} e^{-\lambda x}, \quad 0 \leq x < \infty
\]

E(\text{X}) = \alpha \theta

Var(\text{X}) = \alpha \theta^2

E(\text{X}) = \frac{\alpha}{\lambda},

Var(\text{X}) = \frac{\alpha}{\lambda^2}

If \( T_\alpha \) has a Gamma \((\alpha, \theta = \frac{1}{\lambda}) \) distribution, where \( \alpha \) is an integer, then

\[
F_{T_\alpha}(t) = P(T_\alpha \leq t) = P(X_t \geq \alpha),

\[
P(T_\alpha > t) = P(X_t \leq \alpha - 1),
\]

where \( X_t \) has a Poisson \((\lambda t = \frac{t}{\theta}) \) distribution.

1. Alex is told that he needs to take bus #5 to the train station. He misunderstands the directions and decides to wait for the fifth bus. Suppose that the buses arrive to the bus stop according to Poisson process with the average rate of one bus per 20 minutes.

\( X_t = \) number of buses in \( t \) hours. \hspace{1cm} \text{Poisson} (\lambda t)

\( T_k = \) arrival time of the \( k \)th bus. \hspace{1cm} \text{Gamma}, \( \alpha = k \).

one bus per 20 minutes \hspace{1cm} \Rightarrow \hspace{1cm} \lambda = 3.

a) Find the probability that Alex would have to wait longer than 1 hour for the fifth bus to arrive.

\[
P(T_5 > 1) = P(X_1 \leq 4) = P(\text{Poisson}(3) \leq 4) = 0.815.
\]

OR

\[
P(T_5 > 1) = \int_{1}^{\infty} \frac{3^5}{\Gamma(5)} t^{5-1} e^{-3t} dt = \int_{1}^{\infty} \frac{3^5}{4!} t^4 e^{-3t} dt = \ldots
\]
b) Find the probability that the fifth bus arrives during the second hour.

\[ P(1 < T_5 < 2) = P(T_5 > 1) - P(T_5 > 2) = P(X_1 \leq 4) - P(X_2 \leq 4) \]
\[ = P(\text{Poisson}(3) \leq 4) - P(\text{Poisson}(6) \leq 4) = 0.815 - 0.285 = 0.530. \]

OR

\[ P(1 < T_5 < 2) = \int_{1}^{2} \frac{3}{1!} t^{5-1} e^{-\frac{3}{t}} \, dt = \int_{1}^{2} \frac{3}{4!} t^{5} e^{-\frac{3}{t}} \, dt = \ldots \]

c) Find the probability that the fifth bus arrives during the third hour.

\[ P(2 < T_5 < 3) = P(T_5 > 2) - P(T_5 > 3) = P(X_2 \leq 4) - P(X_3 \leq 4) \]
\[ = P(\text{Poisson}(6) \leq 4) - P(\text{Poisson}(9) \leq 4) = 0.285 - 0.055 = 0.230. \]

1.3. Traffic accidents at a particular intersection follow Poisson distribution with an average rate of 1.4 per week.

\[ \Rightarrow 0.2 \text{ per day.} \]

a) What is the probability that the next accident will not occur for three days?

Exponential, \( \lambda = 0.2. \)

\[ P(T > 3) = e^{-0.2 \cdot 3} = e^{-0.6} \approx 0.5488. \]

OR

Poisson, 3 days \( \Rightarrow \lambda t = 0.2 \cdot 3 = 0.6. \)

\[ P(X = 0) = \frac{0.6^0 e^{-0.6}}{0!} \approx 0.5488. \]
b) What is the probability that the next accident will occur during the third day? 
(That is, the time until the next accident is more than two days, but less than three days.)

Exponential, \( \lambda = 0.2 \).

\[
P(2 < T < 3) = P(T > 2) - P(T > 3) = e^{-0.2 \cdot 2} - e^{-0.2 \cdot 3} = e^{-0.4} - e^{-0.6} \approx 0.1215.
\]

OR

Poisson, 1 day \( \Rightarrow \lambda t = 0.2 \cdot 1 = 0.2 \).

\[
P(X = 0) = \frac{0.2^0 \cdot e^{-0.2}}{0!} \approx 0.81873.
